PROFESSIONAL SUMMARY

CompTIA Security+ certified cybersecurity professional with hands-on experience in SIEM monitoring, alert triage, detection engineering, and incident investigation across Splunk and Microsoft Sentinel. Detected a live SSH brute force attack on a public-facing Azure VM — identified 13 attacker IPs and 158 attempts from a single source, mapped detections to MITRE ATT&CK (T1110.001), and confirmed zero unauthorized successful logins. Skilled in Microsoft Entra ID identity and access management including RBAC, app registrations, and Graph API. Background in emergency medicine brings strong triage instincts, documentation discipline, and the ability to perform under pressure.

CORE SKILLS

SIEM Monitoring | Alert Triage | Threat Detection | Incident Investigation | Detection Engineering | KQL | SPL | Microsoft Sentinel | Splunk | MITRE ATT&CK | Cyber Kill Chain | Phishing Analysis | IOC Identification | IDS/IPS | Log Analysis | Packet Analysis | Wireshark | Incident Documentation | SOAR Automation

Microsoft Azure | Microsoft Entra ID | RBAC | App Registrations | Microsoft Graph API | Identity Governance | Sign-In and Audit Log Analysis | Least-Privilege Access | Cloud Security | UFW | Azure NSGs | nmap | tcpdump | Firewall Configuration | Windows | Linux | TCP/IP | NIST | HIPAA

HANDS-ON EXPERIENCE

Active Directory Attack Detection Lab — Microsoft Sentinel / Windows Server / Azure

- Built a Windows Server 2022 domain controller and domain-joined workstation in Azure, then simulated four core credential attacks: Kerberoasting, AS-REP Roasting, DCSync, and Pass-the-Hash.
- Wrote KQL detections against Windows Security Events for each technique, mapped to MITRE ATT&CK (T1558.003, T1558.004, T1003.006, T1550.002), and built a triage query to confirm which attacks actually succeeded.
- Hardened the domain (AES enforcement, pre-authentication, replication restrictions) and validated each control by re-running the attacks. Mapped to the SC-500 identity domain.

SSH Brute Force Detection & Packet Analysis Lab — Microsoft Sentinel / Wireshark / Azure

- Exposed an Azure VM to the public internet via SSH, forwarded syslog to Microsoft Sentinel via Azure Monitor Agent, and detected a live brute force attack within hours — 13 attacker IPs identified, 158 attempts from a single source, zero unauthorized successful logins confirmed.
- Wrote KQL analytics rules to detect 10+ failed SSH logins per IP per hour and mapped the detection to MITRE ATT&CK (T1110.001, Password Guessing); used nmap for external reconnaissance to view the server the way an attacker would.
- Captured live attack traffic with tcpdump and analyzed the pcap in Wireshark — isolated attacker IPs, identified SSH-2.0 banner strings revealing tool fingerprinting, hardened the Azure NSG, and validated zero external SYN attempts post-remediation. Full pipeline documented (Detect, Analyze, Correlate, Harden, Validate) on GitHub and YouTube.

Microsoft Entra ID Identity and Access Management Labs — Microsoft Azure

- Provisioned identities via manual creation, bulk CSV import, and B2B guest invitations; assigned admin roles using least privilege, registered applications, and configured Microsoft Graph API permissions and custom Azure RBAC roles to enforce separation of duties.
- Analyzed Sign-In Logs and Audit Logs to investigate authentication events and administrative changes across the tenant.

Microsoft Sentinel Detection Lab — Microsoft Azure

- Built a cloud SIEM environment, connected Azure Activity logs, and wrote KQL queries to investigate resource writes, failed operations, and config changes — built analytics rules, identified false positives, and tuned detections to reduce noise.
- Created SOAR-style automation to streamline recurring incident closure and worked the full incident lifecycle: triage, investigation, classification, and closure.

Security Operations Labs — TryHackMe / Splunk

- Built a Splunk SIEM lab on Ubuntu, wrote SPL detections for brute-force activity, investigated false positives, and completed Tier 1 SOC simulations covering phishing investigation and IOC identification using VirusTotal, Any.Run, CyberChef, and Talos.

Networking and Firewall Lab — Windows / Ubuntu / Azure

- Analyzed interfaces, routing, and open ports across Windows, Ubuntu, and Azure using ip a, ss -tulnp, nmap, and Test-NetConnection; configured UFW rules, monitored live BLOCK logs, and validated Azure NSG behavior end-to-end.

PROFESSIONAL EXPERIENCE

Emergency Room Technician | 12/2021 – Present

Children's Hospital of Orange County (CHOC)

- Work in a HIPAA-regulated 24/7 environment — triaging critical information for 400-500 patients daily, escalating time-sensitive issues accurately, and maintaining compliance documentation under pressure with minimal margin for error.
- Coordinate with multidisciplinary teams and communicate clearly to both technical and non-technical stakeholders — the same discipline required in SOC incident response and escalation.
